Statistical distributions

"In probability theory and statistics, a statistical distribution is a mathematical function that provides the probabilities of occurrence of different possible outcomes in an experiment" [Wikipedia].

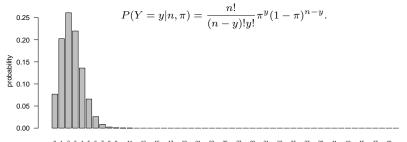

Statistical distributions

"In probability theory and statistics, a statistical distribution is a mathematical function that provides the probabilities of occurrence of different possible outcomes in an experiment" [Wikipedia].

For a given cancer, mutation of the nucleic acid located at position 790 of Exon 20 is assumed to occur with a probability of $\sim 5\%$.

Probability of observing y patients out of n=50 cancer patients with this mutation?

Normalisa of accessors and of EO accessionants

▶ the number of successes out of n trials (experiments), $Y = \sum_{i=1}^{n} X_i$, follows a binomial distribution with parameters n and π :

$$Y \sim Bin(n,\pi),$$

$$P(Y = y | n, \pi) = \frac{n!}{(n-y)!y!} \pi^y (1-\pi)^{n-y}.$$

IF

- ▶ *n* independent experiments,
- ▶ outcome of each experiment is dichotomous (success/failure), ▶ the probability of success π is the same for all experiments,

Some parametric distributions: Poisson distribution

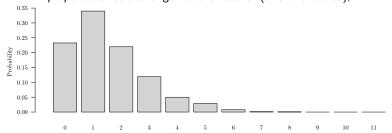

• the number of events occurring in a fixed time interval or in a given area, X, may be modelled by means of a Poisson distribution with parameter λ :

$$X \sim Poisson(\lambda),$$

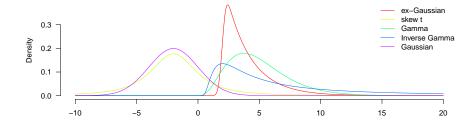

$$P(X = x | \lambda) = \frac{\lambda^x e^{-\lambda}}{x!}.$$

IF, during a time interval or in a given area,

- events occur independently,
- ▶ at the same rate.
- and the probability of an event to occur in a small interval (area) is proportional to the length of the interval (size of the area),

Some parametric distributions: Continuous distrib.

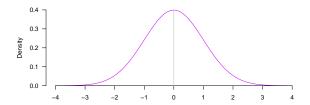

$$X \sim N(\mu, \sigma^2), \qquad f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$\mathsf{E}[X] = \mu, \qquad \mathsf{Var}[X] = \sigma^2,$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}.$$

Probability density function, $f_{Z}(z)$, of a standard normal:

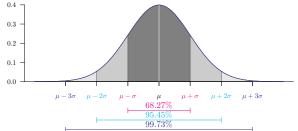

$$X \sim N(\mu, \sigma^2), \qquad f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \, e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$\mathsf{E}[X] = \mu, \qquad \mathsf{Var}[X] = \sigma^2,$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} \, e^{-\frac{z^2}{2}}.$$

Probability density function, $f_Z(z)$, of a standard normal:

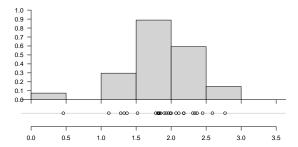

$$X \sim N(\mu, \sigma^2), \qquad f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$\mathsf{E}[X] = \mu, \qquad \mathsf{Var}[X] = \sigma^2,$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}.$$

(i) Suitable modelling for a lot of variables:

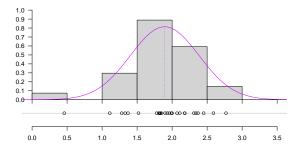

$$X \sim N(\mu, \sigma^2), \qquad f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$\mathsf{E}[X] = \mu, \qquad \mathsf{Var}[X] = \sigma^2,$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}.$$

(i) Suitable modelling for a lot of variables

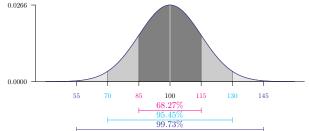

$$X \sim N(\mu, \sigma^2), \qquad f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$\mathsf{E}[X] = \mu, \qquad \mathsf{Var}[X] = \sigma^2,$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}.$$

(i) Suitable modelling for a lot of variables: IQ

$$\begin{split} X \sim N(\mu,\sigma^2), \qquad f_X(x) &= \frac{1}{\sqrt{2\pi\sigma^2}} \; e^{-\frac{(x-\mu)^2}{2\sigma^2}} \\ \mathrm{E}[X] &= \mu, \qquad \mathrm{Var}[X] = \sigma^2, \\ Z &= \frac{X-\mu}{\sigma} \sim N(0,1), \qquad f_Z(z) = \frac{1}{\sqrt{2\pi}} \; e^{-\frac{z^2}{2}}. \end{split}$$

(ii) Central limit theorem (Lindeberg-Lévy CLT)

- ▶ Let $(X_1,...,X_n)$ be n independent and identically distributed (iid) random variables drawn from distributions of expected values given by μ and finite variances given by σ^2 ,
- ▶ then

$$\widehat{\mu} = \overline{X} = \frac{\sum_{i=1}^{n} X_i}{n} \quad \overset{d}{\to} \quad N\left(\mu, \frac{\sigma^2}{n}\right).$$

If $X_i \sim N(\mu, \sigma^2)$, this result is true for all sample sizes.

PART II:

Parametric and non-parametric one-sample location tests

Cancer Research UK -29^{rd} of November 2022

D.-L. Couturier, M. Eldridge & M. Fernandes (Bioinformatics core)

Grand Picture of Statistics

Statistical hypothesis testing

A hypothesis test describes a phenomenon by means of two non-overlapping idealised models/descriptions:

- ▶ the null hypothesis **H0**, "generally assumed to be true until evidence indicates otherwise"
- ▶ the alternative hypothesis **H1**.

The aim of the test is to reject the null hypothesis in favour of the alternative hypothesis, and conclude, with a probability α of being wrong, that the idealised model/description of H1 is true.

Theory 1: Dieters lose more fat than the exercisers

Theory 2: There is no majority for Brexit now

Theory 3: Serum vitamin C is reduced in patients

Statistical hypothesis testing

Several-step process:

- ▶ Define H0 and H1 according to a theory
- ▶ Set α , the probability of rejecting H0 when it is true (type I error),
- Determine the test statistic to be used,
- ▶ Define n, the sample size, allowing you to reject H0 when H1 is true with a probability 1β (Power),
- ► Collect the data,
- Perform the statistical test, define the p-value, and reject (or not) the null hypothesis.

Statistical hypothesis testing

Many options:

One-sided versus two-sided tests,

Exact versus asymptotic tests,

▶ Parametric versus non-parametric tests.

Parametric location test (One-sided) t-test

We test:

H0: $\mu_{IQ} = 100$, H1: $\mu_{IQ} > 100$.

We have $X_i \sim N(\mu, \sigma^2), i = 1, ..., n$,

We know

$$ightharpoonup \overline{X} \sim N\left(\mu, \frac{\sigma^2}{n}\right),$$

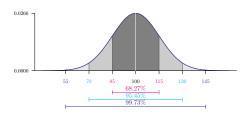

$$Z = \frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}} \sim N(0, 1),$$

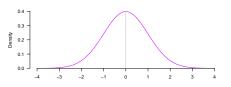

Thus, if H0 is true, we have:

$$Z = \frac{\overline{X} - \mu_0}{\frac{\sigma}{\sqrt{n}}} \sim N(0, 1).$$

Define the p-value:

$$ightharpoonup p - \text{value} = P(T > T_{obs})$$

Statistical tests

4 possible outcomes

Conclude:

- ▶ if p-value $> \alpha$ → do not reject H0. ▶ if p-value $< \alpha$ → reject H0 in favour of H1.

		Test Outcome		
		H0 not rejected		
Unknown Truth	H0 true	$1-\alpha$ [TN]	α [FP]	
	H1 true		$1-\beta$ [TP]	

where

- \triangleright α is the type I error, the probability of rejecting H0 when H0 is correct.
- \triangleright β is the type II error, the probability of not rejecting H0 when H1 is correct.

Warnings

- ▶ 'absence of evidence is not evidence of absence',
- design may help minimising FP and FN (ie, maximising TN and TP).

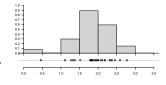

Parametric location test

Student's test

A location model is assumed for X_i , i = 1, ..., n:

$$X_i = \mu + e_i,$$

where $e_i \sim N(\mu_e = 0, \sigma_e^2)$, a symmetrical distribution.

Interest for **H0**: $\mu = \mu_0$ against **H1**: $\mu < \mu_0$ or $\mu \neq \mu_0$ or $\mu > \mu_0$.

Test statistics : $T = \frac{\overline{X} - \mu_0}{\frac{s}{\sqrt{n}}}$..

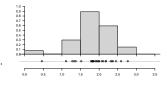

Parametric location test

Student's test

A location model is assumed for X_i , i = 1, ..., n:

$$X_i = \mu + e_i,$$

where $e_i \sim N(\mu_e = 0, \sigma_e^2)$, a symmetrical distribution.

Interest for **H0**: $\mu = \mu_0$ against **H1**: $\mu < \mu_0$ or $\mu \neq \mu_0$ or $\mu > \mu_0$.

Test statistics :
$$T = \frac{\overline{X} - \mu_0}{\frac{s}{\sqrt{n}}}$$
..

Distribution of W under H0: $T \sim Student(df = n - 1)$.

```
One Sample t-test
```

1.893883

```
data: golub[1042, gol.fac == "ALL"]
t = 4.172, df = 26, p-value = 0.0002982

95 percent confidence interval:
1.699817 2.087948
sample estimates:
mean of x
```

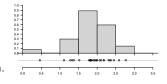

Non-parametric location test Wilcoxon sign-rank test

A location model is assumed for X_i , i = 1, ..., n:

$$X_i = \theta + e_i,$$

where $e_i \sim iid(\mu_e = 0, \sigma_e^2)$, a symmetrical distribution.

Interest for **H0**: $\theta = \theta_0$ against **H1**: $\theta < \theta_0$ or $\theta \neq \theta_0$ or $\theta > \theta_0$.

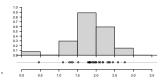

Test statistics : $W^+ = \sum_{i=1}^n \iota(X_i - \theta_0 > 0) \ \mathsf{Rank}(|X_i - \theta_0|).$

Non-parametric location test Wilcoxon sign-rank test

A location model is assumed for X_i , i = 1, ..., n:

$$X_i = \theta + e_i,$$

where $e_i \sim iid(\mu_e = 0, \sigma_e^2)$, a symmetrical distribution.

Interest for **H0**: $\theta = \theta_0$ against **H1**: $\theta < \theta_0$ or $\theta \neq \theta_0$ or $\theta > \theta_0$.

Test statistics :
$$W^+ = \sum_{i=1}^n \iota(X_i - \theta_0 > 0) \operatorname{Rank}(|X_i - \theta_0|).$$

Distribution of W under H0: W^+ has no closed-form distribution.

```
Wilcoxon signed rank exact test
```

```
data: golub[1042, gol.fac == "ALL"]
V = 333, p-value = 0.0002363
alternative hypothesis: true location is not equal to 1.5
95 percent confidence interval:
1.73868 2.09106
sample estimates:
(pseudo)median
1.926475
```

Parametric or non-parametric?

T-test		Outcome(s) normally distributed			
	-	Yes	Mildly	No	
	Small				
Sample size	Medium				
	Large				

Situations which may suggest the use of non-parametric statistics:

- ▶ When there is a small sample size or very unequal groups,
- ▶ When the data has notable outliers,
- ▶ When one outcome has a distribution other than normal,
- ▶ When the data are ordered with many ties or are rank ordered.

Non-parametric does not mean assumption free

Introduction to Shiny Apps and Exercises

PART III:

Parametric and non-parametric two-sample location tests

Cancer Research UK -29^{rd} of November 2022

D.-L. Couturier, M. Eldridge & M. Fernandes (Bioinformatics core)

Two-sample case

Many options:

One-sided versus two-sided tests,

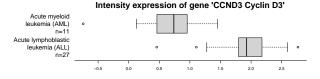

Exact versus asymptotic tests,

▶ Parametric versus non-parametric tests,

► Tests for paired versus independent data.

Parametric two-sample location test Two-sample two-sided Student-s & Welch's t-tests

We test **H0**: $\mu_Y - \mu_X = 0$ against **H1**: $\mu_Y - \mu_X \neq 0$.

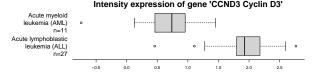

We know:

- $\blacktriangleright \ \, \text{Student's t-test [assume } \sigma_X^2 = \sigma_Y^2] \colon \, \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{s_p \sqrt{\frac{1}{n_X} + \frac{1}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, n_X + n_Y 2}$
- $\qquad \text{Welch's t-test [assume } \sigma_X^2 \neq \sigma_Y^2] \text{: } \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{\sqrt{\frac{s_X^2}{n_X} + \frac{s_Y^2}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, df}$

Parametric two-sample location test

Two-sample two-sided Student-s & Welch's t-tests

We test $\mathbf{H0}$: $\mu_Y - \mu_X = 0$ against $\mathbf{H1}$: $\mu_Y - \mu_X \neq 0$.

We know:

- $\blacktriangleright \ \, \text{Student's t-test [assume } \sigma_X^2 = \sigma_Y^2] \colon \, \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{s_p \sqrt{\frac{1}{n_X} + \frac{1}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, n_X + n_Y 2}$
- $\qquad \text{Welch's t-test [assume } \sigma_X^2 \neq \sigma_Y^2] \text{: } \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{\sqrt{\frac{s_X^2}{n_X} + \frac{s_Y^2}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, df}$

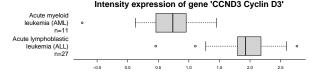

Two Sample t-test

```
data: golub[1042, gol.fac == "ALL"] and golub[1042, gol.fac == "AML"]
t = 6.7983, df = 36, p-value = 6.046e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
    0.8829143    1.6336690
sample estimates:
mean of x mean of y
    1.8938826    0.6355909
```

Parametric two-sample location test

Two-sample two-sided Student-s & Welch's t-tests

We test $\mathbf{H0}$: $\mu_Y - \mu_X = 0$ against $\mathbf{H1}$: $\mu_Y - \mu_X \neq 0$.

We know:

- $\blacktriangleright \ \, \text{Student's t-test [assume } \sigma_X^2 = \sigma_Y^2] \colon \, \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{s_p \sqrt{\frac{1}{n_X} + \frac{1}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, n_X + n_Y 2}$
- $\qquad \text{Welch's t-test [assume } \sigma_X^2 \neq \sigma_Y^2] \text{: } \frac{(\overline{Y} \overline{X}) (\mu_Y \mu_X)}{\sqrt{\frac{s_X^2}{n_X} + \frac{s_Y^2}{n_Y}}} \sim t_{1 \frac{\alpha}{2}, df}$

Welch Two Sample t-test

```
data: golub[1042, gol.fac == "ALL"] and golub[1042, gol.fac == "AML"]
t = 6.3186, df = 16.118, p-value = 9.871e-06
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
    0.8363826   1.6802008
sample estimates:
mean of x mean of y
1.8938826   0.6355909
```

Non-parametric two-sample location test Mann-Whitney-Wilcoxon test

Let

- $X_i \sim iid(\mu_X, \sigma^2), i = 1, ..., n_X,$
- $Y_i \sim iid(\mu_X + \delta, \sigma^2), i = 1, ..., n_Y.$

Interest for **H0**: $\delta = \delta_0$ against **H1**: $\delta < \delta_0$ or $\delta \neq \delta_0$ or $\delta > \delta_0$.

Standardised test statistic:
$$z = \frac{\sum_{i=1}^{n_Y} R(Y_i) - [n_Y(n_X + n_Y + 1)/2]}{\sqrt{n_X n_Y(n_X + n_Y + 1)/12}} \text{,}$$

where $R(Y_i)$ denotes the rank of Y_i amongst the combined samples, i.e., amongst $(X_1, ..., X_{n_Y}, Y_1, ..., Y_{n_Y})$.

Non-parametric two-sample location test

Mann-Whitney-Wilcoxon test

Let

- $X_i \sim iid(\mu_X, \sigma^2), i = 1, ..., n_X,$
- $Y_i \sim iid(\mu_X + \delta, \sigma^2), \ i = 1, ..., n_Y.$

Interest for **H0**: $\delta = \delta_0$ against **H1**: $\delta < \delta_0$ or $\delta \neq \delta_0$ or $\delta > \delta_0$.

Standardised test statistic:
$$z = \frac{\sum_{i=1}^{n_Y} R(Y_i) - [n_Y(n_X + n_Y + 1)/2]}{\sqrt{n_X n_Y(n_X + n_Y + 1)/12}},$$

where $R(Y_i)$ denotes the rank of Y_i amongst the combined samples, i.e., amongst $(X_1,...,X_{n_X},Y_1,...,Y_{n_Y})$.

```
Distribution of Z under H0: Z \sim N(0,1).
```

```
Implementation 1: statistic = -4.361334 , p-value = 1.292716e-05
```

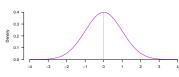

```
Implementation 2:
W = 284, p-value = 6.15e-07
```

alternative hypothesis: true location shift is not equal to 0 95 percent confidence interval:

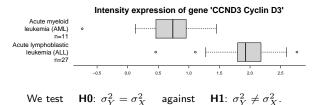

0.89647 1.57023

sample estimates:
difference in location

1.21951

F-test of equality of variances

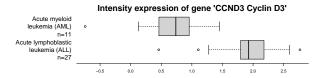

We know:

► F-test [assume $X_i \sim N(\mu_X, \sigma_X)$ and $Y_i \sim N(\mu_Y, \sigma_Y)$]: $\frac{s_Y^2}{s_X^2} \sim F_{n_Y-1, n_X-1}$

F-test of equality of variances

$$\mbox{We test} \quad \mbox{\bf H0:} \; \sigma_Y^2 = \sigma_X^2 \quad \mbox{ against } \quad \mbox{\bf H1:} \; \sigma_Y^2 \neq \sigma_X^2.$$

We know:

► F-test [assume $X_i \sim N(\mu_X, \sigma_X)$ and $Y_i \sim N(\mu_Y, \sigma_Y)$]: $\frac{s_Y^2}{s_X^2} \sim F_{n_Y-1, n_X-1}$

F test to compare two variances

Warning

Multiplicity correction

For each test, the probability of rejecting H0 (and accept H1) when H0 is true equals α .

For k tests, the probability of rejecting H0 (and accept H1) at least 1 time when H0 is true, α_k , is given by

$$\alpha_k = 1 - (1 - \alpha)^k.$$

Thus, for $\alpha = 0.05$,

- if k = 1, $\alpha_1 = 1 (1 \alpha)^1 = 0.05$,
- \blacktriangleright if k=2, $\alpha_2=1-(1-\alpha)^2=0.0975$,
- if k = 10, $\alpha_{10} = 1 (1 \alpha)^{10} = 0.4013$.

Idea: change the level of each test so that $\alpha_k = 0.05$:

- ▶ Bonferroni correction : $\alpha = \frac{\alpha_k}{k}$,
- ▶ Dunn-Sidak correction: $\alpha = 1 (1 \alpha_k)^{1/k}$.

Warning

Non-parametric is not assumption free: Type I error

Simulate 2500 samples with

- $X_i \sim Uniform(1.5, 2.5), i = 1, ..., n_X$
- $Y_i \sim Uniform(0,4), i = 1,...,n_Y,$

so that $\mathsf{E}[X_i] = \mathsf{E}[Y_i] = 2$ (i.e., same mean, same median).

Assume

- $X_i \sim iid(\mu_X, \sigma^2), i = 1, ..., n_X,$
- $Y_i \sim iid(\mu_X + \delta, \sigma^2), i = 1, ..., n_Y.$

Test **H0**: $\delta = \delta_0$ against **H1**: $\delta \neq \delta_0$, at the 5% level, by means of

- Mann-Whitney-Wilcoxon test (MWW),
- ► T-test,
- Welch-test.

\widehat{lpha}		Tests		
		MWW	Student's t-test	Welch's test
Sample size	$n_X = 200, n_Y = 70$	0.145	0.202	0.055
	$n_X = 20, n_Y = 7$	0.148	0.240	0.062
